## INCOME IN 1967 OF PERSONS IN THE UNITED STATES

The median income of men advanced to about \$5,600 in 1967, up \$330 or 6 percent from the revised figure of about \$5,200 from the preceding year.<sup>1</sup> However, since consumer prices rose 3 percent between 1966 and 1967 the gain in real purchasing power was approximately 3 percent.<sup>2</sup> The median income of nonwhite men was \$3,400, up 11 percent from the revised 1966 figure of \$3,100. There was also an increase in the median income for white men. There were 108 million income recipients 14 years old and over in 1967--61

<sup>1</sup>Based on revised methodology. The income data in the March 1968 Current Population Survey (CPS) were affected by the changeover to a new computer system and the introduction of improved methods of processing the data. Also, field interviewing procedures were strengthened in the March 1968 CPS. Consequently, data shown in this report are not strictly comparable with prior CPS income data. For example, the percentage change between 1966 and 1967 in median income of persons 14 years old and over based on the revised methodology is 7.9 percent. The comparable percentage change based on the original methodology is 7.3 percent, or a difference of about 1 percentage point. See page 15 of this report for further discussion.

<sup>2</sup>See Monthly Labor Review, Vol. 91, No. 11, February 1968, table D-1, page 121.

million men and 47 million women. About three-fourths of all persons 14 and over were income recipients.

Approximately 61 percent of the civilian male income recipients reported working 50 weeks or more at full-time jobs in 1967. This was about the same proportion as in 1966. The median income of this group in 1967 was \$7,300, a 6 percent increase over the revised 1966 figure of about \$6,900.

The median income of women in 1967 was \$1,800, 9 percent above the revised 1966 figure of about \$1,700. The proportion of women receiving income continued to increase, reaching 64 percent in 1967 as compared with 39 percent in 1947. Approximately 32 percent of the female income recipients reported working 50 weeks or more at full-time jobs during 1967. The median income of year-round full-time women workers in 1967 was about \$4,300, an 8 percent increase over the revised 1966 figure of about \$3,900.

Median wage or salary earnings of all wage and salary workers increased about 6 percent from 1966 to 1967. After adjustment for price increase, the gain in real earnings was 3 percent (table A).

<sup>r</sup> Based on revised methodology. The median earnings values for 1966 were adjusted for price increases using the 1966 Consumer Price Index (1967 = 100) as published by the Bureau of Labor Statistics in the Monthly Labor Review, Vol. 91, No. 11, February 1968, table D-1.

The data presented in this report were derived from the Current Population Survey conducted by the Bureau of the Census and are subject to sampling variability, which may be relatively large for the smaller figures and for small differences between figures. For a further discussion of the sampling variability, see the section on "Reliability of the estimates," below.

#### **RELATED REPORTS**

Current Population Survey.--Other data based on the Current Population Survey showing the distributions of households, families, unrelated individuals, and persons, by income levels, have been published in the Series P-60 reports, Nos. 1 to 59. Occasionally, tables showing the cross-classification of income and other characteristics have been published in the Series P-20 reports of the Bureau of the Census and in the Bureau of Labor Statistics, Special Labor Force Reports. Series P-60, No. 59, "Income in 1967 of Families" contains 1967 family income cross-classified by various family characteristics.

A historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper No. 8, Trends in the Income of Families and Persons in the United States: 1947 to 1960, published in 1963. This report contains detailed tables showing income distributions in constant (1959) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, urban and rural. Similar data are also shown for males and females classified by the amount of their own income and various personal characteristics.

A report entitled Technical Paper No. 17, Trends in the Income of Families and Persons in the United States: 1947 to 1964, issued in 1967, updates the information contained in Technical Paper No. 8. This report includes essentially the same information as Technical Paper No. 8 except for the following: Technical Paper No. 8 shows income data in terms of constant 1959 dollars whereas this report updates and revises income information in terms of constant 1964 dollars. Income data and various characteristics are cross-classified by nonfarm and farm rather than by urban and rural categories. In addition, new income information covering work experience, occupation of longest job, and source of income has been added.

1960 Census.--Income data collected in the 1960 Census of Population appear in a number of published reports. Basic distributions of persons 14 years old and over, families, and unrelated individuals, by money income in 1959, for the

United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in 1960 Census of Population, Vol. I, Characteristics of the Population, chapter C, "General Social and Economic Characteristics." Statistics on income in 1959 by detailed characteristics, including cross-classifications by age, weeks worked, education, type of family, etc., are presented in 1960 Census of Population, Vol. I, Characteristics of the Population, chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States, large counties, and standard metropolitan statistical areas of 250,000 or more.

Detailed cross-classifications on the income in 1959 of families and persons by their social and economic characteristics, for the United States, regions, and type of residence are published in 1960 Census of Population, Subject Reports, Sources and Structure of Family Income, Series PC(2)-4C. Major emphasis is placed on the composition of family income and the major sources of this income, i.e., wages and salaries, self-employment, and other income. The tables for persons present information on the contribution to family income of the head, wife, children, and older family members and show the mean incomes for occupation groupings cross-classified by industry groupings, color, and sex.

Cross-tabulations by earnings in 1959, age, and educational attainment of males 18 to 64 years old, for the United States, the South, and the other three regions combined are published in 1960 Census of Population, Occupation by Earnings and Education, Series PC(2)-7B. Data on the income of families in which the head or the wife was 65 years old and over and on the income of persons 65 years old and over classified by a number of characteristics are presented for the United States, each of the States, and standard metropolitan statistical areas of 250,000 or more in 1960 Census of Population, Income of the Elderly Population, Series PC(2)-8B.

Statistics on income in 1959 of primary families or individuals by housing and household characteristics, such as tenure, household composition, condition and plumbing facilities, and gross rent and value, are presented in 1960 Census of Housing, Volume II, Metropolitan Housing, for the United States by geographic divisions and for each standard metropolitan statistical area and place of 100,000 inhabitants or more. Additional data on income cross-tabulated by housing and household subjects are presented in 1960 Census of Housing, Volume V, Part 1, Residential Finance--Homeowner Properties; Volume VI, Rural Housing; and Volume VII, Housing of Senior Citizens. Also, a monograph, Income Distribution in the United

## DEFINITIONS AND EXPLANATIONS

ates, sponsored jointly by the Bureau of the Census and the Social Science Research Council, was published in 1966. Technical Paper No. 16, Present Value of Estimated Lifetime Earnings, by H. P. Miller and R. Hornseth, published in 1967, presents estimates of the present value of estimated lifetime earnings for men in 10 major occupation groups classified by color, earnings, and years of school completed.

Statistics on income in 1959 collected in the Current Population Survey of March 1960 may differ from data for that year from the decennial census despite the fact that the same basic concept was used in both instances.

In the first place, the survey data exclude the institutional population and most members of the Armed Forces living on post. These two groups were included in the census. Secondly, college students are generally enumerated at their own homes in the Current Population Survey and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals. Thirdly, the small group of Current Population Survey enumerators were more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Moreover, income data in the Current Population Survey are based on responses to separate questions on eight detailed types of income, whereas in the census only three broad questions were used.

1950 Census.--Distributions of persons 14 years old and over by total money income in 1949 appear in the publication, U.S. Bureau of the Census, 1950 Census of Population, Volume II, chapter C. Similar data for families and unrelated individuals appear in Volume II, chapter B. Data for the United States and regions appear in Volume II, Part 1, United States Summary, whereas separate data for individual States are presented in the other parts. Various special reports contain additional income data; however, there is no special report dealing exclusively with income data. In addition, a monograph, Income of the American People, sponsored jointly by the Bureau of the Census and the Social Science Research Council, was published in 1955.

1940 Census.--Data relating to wage and salary income in 1939 have been presented in several different reports of the Sixteenth Decennial Census. A complete list of these reports is shown in earlier Current Population Survey reports on consumer income.

Population coverage.--This report includes the civilian noninstitutional population of the United States plus approximately 1,078,000 members of the Armed Forces in the United States living off post or with their families on post in 1968, but excludes all other members of the Armed Forces.

Farm-nonfarm residence.--The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the March 1968 survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 Census but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to \$50 or more?" If the acreage response is "No," the inquiry relates to sales of \$250 or more. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population.

The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Metropolitan-nonmetropolitan residence.--The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1960 Census and does not include any subsequent additions or changes.

Central cities.--Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two

city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Household.--Through 1959, a household included all of the persons who occupied a house, an apartment, or other group of rooms, or a room, which constituted a dwelling unit under the 1950 Census rules. Since 1960, a household includes all of the persons who occupy a house, an apartment, or other group of rooms, or a room, which constitutes a housing unit under the 1960 Census rules.

Dwelling unit, 1950.--A group of rooms occupied as separate living quarters was regarded as a dwelling unit if it had separate cooking equipment or a separate entrance; a single room occupied as separate living quarters was a dwelling unit if it had separate cooking equipment, or, if in a regular apartment house, most of the units had separate cooking equipment, or if it constituted the only living quarters in the structure. The count of households excluded groups of persons living as members of a quasi-household. A quasi-household was defined as the occupants of a rooming house containing five or more persons not related to the head, or the occupants of certain other types of living quarters such as dormitories, military barracks, and institutions.

Housing unit, 1960.--A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters, that is, when the occupants do not live and eat with any other persons in the structure, and when there is either (1) direct access from the outside or through a common hall, or (2) a kitchen or cooking equipment for the exclusive use of the occupants. The count of households excludes persons living in group quarters. The kinds of living quarters occupied by quasi-households under the 1950 definitions generally are group quarters under the 1960 definitions. Some quarters formerly regarded as occupied by quasi-households, however, have been divided into housing units because the occupants live separately and their quarters qualify as housing units under the 1960 definition.

Family.--The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are

in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not as part of the household head's family.

Unrelated individual.--The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Income.--For each person in the sample 14 years old and over, questions were asked on the amount of money income received in 1967 from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security; (5) dividends, interest (on savings or bonds), income from estates or trusts, or net rental income; (6) public assistance or welfare payments; (7) unemployment compensation, government employee pensions, or veterans' payments; (8) private pensions, annuities, alimony, regular contributions from persons not living in this household, net royalties, and other periodic income.

The amounts received represent income before deductions for personal taxes, Social Security, bonds, etc. When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., \$10,000 to \$15,000 was coded as \$12,500). Open-ended amounts were converted to designated specific amounts; e.g., over \$10,000 was coded as \$16,000.

It should be noted that although the income statistics refer to receipts during 1967 the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to March 1968. The income of the family does not include amounts received by persons who were members of the family during all or part of the calendar year 1967 if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts

reported by related persons who did not reside with the family during 1967 but who were members of the family at the time of enumeration.

Data on consumer income collected by the Bureau of the Census cover money income (exclusive of certain money receipts such as capital gains) prior to deductions for taxes. The fact that many farm families receive part of their income in the form of rent-free housing and goods produced and consumed on the farm, rather than in money, should be taken into consideration in comparing the income of farm and nonfarm residents. It should be noted that nonmoney incomes are also received by some nonfarm residents. They often take the form of business expense accounts, use of business transportation and facilities, full or partial compensation by business for medical and educational expenses, etc. In analyzing size distributions of income, it should be recognized that capital gains tend to be concentrated more among higher income units than among lower ones.

Money wages or salary.--This is defined as the total money earnings received for work performed as an employee during the calendar year 1967. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment.--This is defined as net money income (gross receipts minus expenses) from his own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were not considered in determining net income; however, replies based on income tax returns or other official records do reflect inventory changes. The value of salable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment.--This is defined as net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs,

farm taxes (not State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were not considered in determining net income; however, replies based on income tax returns or other official records do reflect inventory changes.

Social Security.--This is defined as Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration and railroad retirement insurance checks from the U.S. Government.

Dividends, interest (on savings or bonds), income from estates or trusts, or net rental income.--This category includes dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, and receipts from boarders or lodgers.

Public assistance or welfare payments.--This category includes public assistance payments such as old-age assistance, aid to families with dependent children, and aid to the blind or totally disabled.

Unemployment compensation, government employee pensions, or veterans' payments.--This category includes: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors; (3) money paid periodically by the Veterans' Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; also includes (4) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private pensions, annuities, alimony, regular contributions from persons not living in the household, royalties, and other periodic income.--The following types of income are included in this group: (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) periodic receipts

from annuities or insurance; (3) alimony and child support; (4) contributions received periodically from persons not living in the household; (5) net royalties; and (6) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income.--Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

Total money earnings.--These are defined as the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment.

Income other than earnings.--This is defined as the algebraic sum of all sources of money income except wages and salaries and income from self-employment. The various types of income other than earnings are not shown separately in any of the tables in this report. Separate data are shown for the total amount of income other than earnings in table 16.

Total money income.--This is defined as the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings.

Head of family.--One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples related to the head of a family are included in the head's family and are not classified as separate families.

Married, wife present.--A man was classified as "married, wife present" if his wife was reported as a member of the household or a group quarter, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration.

Number of earners.--This number includes all persons in the family with \$1 or more in wages and salaries, or \$1 or more or a loss in net income from farm or nonfarm self-employment.

Age.--The age classification is based on the age of the person at his last birthday.

Color and race.--The term "color" refers to the division of the population into two groups, white and nonwhite. The nonwhite group includes Negroes, Indians, Japanese, Chinese, and other nonwhite races. This report generally includes data for white and Negro only.

Years of school completed.--Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Employed.--Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed.--Unemployed persons are those civilians who had no employment during the survey week, were available for work, and

1. had engaged in any specific jobseeking activity within the past four weeks. Principal activities include: registering at a public or

rivate employment office; meeting with prospective employers; checking with friends or relatives; placing or answering advertisements; writing letters of application; or being on a union or professional register;

2. were waiting to be called back to a job from which they had been laid off; or

3. were waiting to report to a new wage or salary job scheduled to start within the following 30 days.

Labor force.--Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "experienced civilian labor force" comprises employed workers and experienced unemployed workers.

Not in labor force.--All civilians 14 years old and over who are not classified as employed or unemployed are defined as "not in labor force." These persons include those "engaged in own home housework," "in school," "unable to work" because of long-term physical or mental illness, and "other," the latter group including for the most part retired persons, those too old to work, seasonal workers for whom the survey week fell in an "off" season, and the voluntarily idle. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation, industry, and class of worker.--The data on occupation, industry, and class of worker of employed persons in tables 5, 17, and 18 refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The data on occupation, industry, and class of worker in tables 6, 7, 8, and 9 refer to the civilian job held longest during the year.

The occupation and industry groupings used here are mainly the major groups used in the 1960 Census of Population. The composition of these groups is shown in Volume I, Characteristics of the Population, Part 1, United States Summary, chapter D. The categories used are either detailed classifications or combinations thereof.

The occupational and industrial classification systems used in 1940 and 1950 are basically the same as those used in 1960. There are a number of differences, however, in the specific content of particular groups, as well as several differences in title; however, it is believed that the 1940-60 relationships shown by the data are not significantly affected by these differences. The 1940

classification by class of worker is comparable with the 1960 classification.

Class of worker.--In tables 5, 6, 7, and 9, two or more of the major occupation groups are subdivided by class of worker into two groups: Wage and salary workers and self-employed workers. The former refers to persons working for wages, salaries, commissions, tips, pay "in kind," or at piece rates for a private employer, or for any governmental unit. The latter refers to persons working in their own business, profession or trade, for profit or fees. Included in the self-employed groups in tables 5, 6, and 7 are unpaid family workers, i.e., persons working without pay in a business operated by a member of the household to whom they are related by blood, marriage, or adoption.

Work experience in 1967.--A person with work experience in 1967 is one who did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in 1967.--Persons are classified according to the number of different weeks during 1967 in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs.--A person is classified as having worked at part-time jobs during 1967 if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker.--A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during 1967.

Nonworker.--A nonworker is one who did not do any civilian work in 1967.

Median income.--The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for persons are based on the distributions of persons with income. The medians for wage or salary income, income from nonfarm self-employment, income from farm self-employment, and income other than earnings are based on the distributions of persons or families and individuals having these types of income.

The difference in the size of the income intervals used to compute median income can have a sizable effect on the interpolated median values. As a general rule, median income values published in the Series P-60 reports are calculated using the income intervals shown in the tables in which the median values are shown. In the present report, income intervals are shown in greater detail in table 1 than they are in most of the remaining tables; in the income range from \$3,000 to \$4,999, the intervals are \$500 in table 1 but \$1,000 in the other tables. Consequently, medians based on the intervals shown in table 1 would be different from those in the other tables. For example, median

income for nonwhite males is \$3,358 when based on intervals in table 1 and \$3,448 when based on the broader intervals in the other tables. For consistency from table to table, the medians shown in table 1, therefore, were computed from intervals shown in the remaining tables rather than from those in table 1.

Since the income intervals of most tables have been revised for this report, there is also some lack of comparability between medians shown in this report and those in corresponding tables of earlier reports. Comparable medians can be computed by combining categories as necessary to

Table B.--SELECTED CHARACTERISTICS--MEDIAN INCOME IN 1967 AS SHOWN IN THIS REPORT AND AS CALCULATED USING THE INTERVALS SHOWN IN SPECIFIED TABLES OF SERIES P-60, NO. 53

$$^1 (3) = \left( \frac{[(1) - (2)]}{(2)} \right) \times 100.$$

NOTE.--Years of school completed restricted to persons 25 years old and over.

Obtain identical income intervals for the years being compared. Table B shows corresponding medians for selected categories of persons for 1967, based on income intervals used in 1966 and on income intervals used in tables 2 through 18 of this report. In table 15 which presents historical data, medians are based on the more detailed income intervals used in the past.

Mean income.--The mean income is the amount obtained by dividing the total aggregate income of a group by the number of persons with income in that group.

Rounding.--Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0.

Base figures.--An estimate of the size of the base (number of persons) of each percent distribution by income in 1967 is shown in most of the tables in this report.

#### COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Office of Business Economics personal income series.--The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Office of Business Economics of the Department of Commerce (OBE). The lack of correspondence stems from the following differences in definition and coverage:

1. Income definition.--The personal income series includes, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 5 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. Source of data.--The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section on "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 97 percent of the comparable money wage or salary aggregates included in the personal income series prepared by the OBE.

3. Population coverage.--The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States. In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the OBE but is excluded from the OBE's family income distributions.

4. Average income.--Most of the average income figures published by the OBE represent mean personal incomes, i.e., they were obtained by dividing an aggregate personal income by a total number of persons (or families). The census averages in this report, on the other hand, are median incomes, representing the point on the money income scale above and below which one-half of the persons receiving income are to be found. Because of the shape of the income distribution curve, median incomes are considerably smaller than mean incomes. Furthermore, certain of the OBE average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for families, unrelated individuals or income recipients 14 years old and over.

Percent changes in average income from one period to the next, and percent differences in average income among component groups of the population within any one period, will not necessarily correspond for these various averages. This is so because the shape of the income distribution curve changes over time and varies among population groups at any given time.

12

In most cases the schedule entries for income are based on memory rather than on records, and in the majority of cases on the memory or knowledge of one person, usually the wife of the family head. The memory factor in data derived from field surveys of income probably produces underestimates because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstanding as to the scope of the income concept.

The standard error is primarily a measure of sampling variability, that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration

errors, but it does not measure, as such, any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

The figures presented in table C are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the table of standard errors provides an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

Table C.--STANDARD ERRORS OF ESTIMATED PERCENTAGE OF PERSONS

Estimated percentage	Base of estimated percentage (thousands)									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000
2 or 98.....	2.2	1.4	1.0	0.7	0.4	0.3	0.2	0.1	0.1	0.1
5 or 95.....	3.5	2.2	1.6	1.1	0.7	0.5	0.4	0.2	0.1	0.1
10 or 90.....	4.8	3.0	2.1	1.5	1.0	0.7	0.5	0.3	0.2	0.2
25 or 75.....	6.9	4.4	3.1	2.2	1.4	1.0	0.7	0.4	0.3	0.2
50.....	8.0	5.1	3.5	2.5	1.6	1.1	0.8	0.5	0.4	0.3

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percent is large (50 percent or greater).

Table C shows the standard errors of the estimated percentage of persons in a given category.

Illustration of use of the table of standard errors of percentages: Table 1 shows that an estimated 10.8 percent of Negro males with income had an income of \$5,000 to \$5,999 in 1967. Since the base of this percentage is 5,574,000 Negro males with income, interpolation in table C shows that the standard error of the estimated 10.8 percent is approximately 0.7 percent. The chances are about 68 out of 100 that a census would have shown the percentage to be greater than 10.1

percent, but less than 11.5 percent. The chances are about 95 out of 100 that the census result would have differed from the sample estimate by less than 1.4 percent.

The tables in this report present estimates of median income as well as the corresponding distributions. The sampling variability of an estimated median depends upon the distribution as well as on the size of the base (see table D).

Confidence limits of a median based on sample data may be estimated as follows: (1) from table C using the appropriate base, determine the standard error of a 50-percent characteristic, (2) add to and subtract from 50 percent the standard error determined in step (1), and (3) the confidence interval for the median corresponding to the two points established in step (2) are then read off the distribution of the characteristic. A two-standard-error confidence limit may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error shown in table C.

<sup>1</sup>One standard error. (Chances are about 68 out of 100 that a census would have shown the median to be within the indicated range.)

<sup>2</sup>Two standard errors. (Chances are about 95 out of 100 that a census would have shown the median to be within the indicated range.)

<sup>3</sup>For medians which have a base larger than 100 million use the standard error for 100 million.

Illustration of the computation of the standard error of a median: The median income of male self-employed managerial workers was \$7,239 in 1967 (table 5). There were an estimated 1,857,000 males with this occupation who had income.

1. From table C, the standard error of 50 percent of these persons expressed as a percentage is about 2.0 percent.

2. As we are usually interested in the confidence interval for the median at the two-standard-error level, we add and subtract twice the standard error obtained in step (1). This yields percentage limits of 46.0 and 54.0.

3. Since 40.3 percent of these families had incomes below \$6,000 and 7.6 percent had incomes between \$6,000 and \$6,999, the dollar value of the lower limit may be found by linear interpolation to be

$$\frac{46.0 - 40.3}{7.6} \times \$1,000 + \$6,000 = \$6,750.$$

Since 47.9 percent of these families had incomes below \$7,000 and 9.0 percent had incomes between \$7,000 and \$7,999, the dollar value of the upper limit is found to be

$$\frac{54.0 - 47.9}{9.0} \times \$1,000 + \$7,000 = \$7,678.$$

The chances are about 95 out of 100 that a census would have shown the median to be greater than \$6,750 but less than \$7,678.

Cross-classification of income and work experience data.--This report presents data showing income of persons with varying amounts of work experience in 1967. Information about the civilian work experience of persons in the United States was obtained in the February and April 1968 Current Population Surveys. Information obtained in February and April was matched with the data secured in March for the 50,000 households. In income reports prior to 1965 only persons included in the February and March Surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person within a given classification, but no respondent with similar economic and demographic characteristics.

Estimates of the proportion of year-round full-time workers in specified subgroups in the

population are shown in various tables in this report. All persons in the Armed Forces in February, March, and April 1968 are excluded from the computation of the proportions of year-round full-time workers.

It should be noted that the proportions of year-round full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, Special Labor Force Reports, "Work Experience of the Population." The difference is due largely to the fact that the proportions are not based on exactly the same groups. The proportions presented in the Special Labor Force Reports relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but also many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

#### NONRESPONSES AND ALLOCATIONS

In the March 1968 CPS, no information was recorded for approximately 5 percent of the 50,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the same sample areas were increased accordingly. In addition, complete income information was not reported for about 17 percent of all families and about 11 percent of all persons 14 years old and over in households that were interviewed.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics. Beginning with the March 1962 survey, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, color, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did

respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958, a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See Current Population Reports, Series P-60, No. 33, tables F and G.)

The use of more advanced electronic equipment has enabled the Bureau of the Census to introduce improved income edit and allocation procedures for the March 1968 CPS data. The main feature of the new procedures was a more refined method for imputing missing income data which expands the use of information already known about that person. Among the major improvements made affecting the income data are the following: (1) an expanded set of social and economic characteristics within which the imputations are made; in addition to age,

color, occupation, and weeks worked, the new procedures include sex and type of family member as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the new imputation procedure assigns missing earnings entries first and then utilizes the earnings information to assign missing sources of income other than earnings.

Comparison of 1966 income data according to new and old editing and allocation procedures.-- In order to evaluate the impact of the new procedures, the income data from the March 1967 CPS were rerun, thus providing a bridge for the 1966 income year showing the results of both the earlier and the new procedures.

The general impact of the new allocation procedure was to increase median income for women and to decrease it for men. The median income in 1966 of women increased about \$40 from \$1,640 to \$1,680, between the new and old procedures, while the median income for men decreased about \$60 from \$5,300 to \$5,240 (see table E). Another result of the procedural change was to increase the number of income recipients in 1966 by about 1.7 million. Women accounted for about 1.5 million of this increase. This relatively large increase in the number of female income recipients results from the increase in the number of women earners (see table F). Hence the number of women with wage or salary income and nonfarm self-employment income increased 1.3 million and 500,000, respectively. The number of men with

With no income other than earnings.....	92,783	92,063	39,108	38,575	53,675	53,488
With income other than earnings.....	44,760	45,496	26,205	26,760	18,555	18,73

wage or salary income increased by only 46,000, while the number of men with nonfarm self-employment and with farm self-employment increased by 254,000 and 149,000, respectively.

Even though the number of income recipients increased, the number of recipients with income other than earnings decreased by 700,000 between the old and new procedures. Men accounted for 75 percent of this decrease in the number of recipients with income other than earnings.

The number of civilian workers increased by about 900,000 while the number of nonworkers decreased by about the same amount (see table G). Most of the increase in the number of workers is attributable to more year-round full-time workers.

Further analysis shows that the work experience classifications for men and women were affected differently by the procedural changes. For men, the total number of full-time workers increased by only 390,000, but the number of men working

year round full time increased by 490,000, indicating that there was an upward shift in the number of weeks worked by full-time workers. However, for women, the number of full-time workers increased by 435,000, but the number of year-round full-time workers increased by only 255,000, between the new and old procedures.

Between the old and new procedures, the number of persons with one or more allocations increased by about 2.4 million (1.9 million for women and about 550,000 for men, see table H). This increase in the number of persons with one or more allocations (as well as the increase in the number of income recipients and number of workers) is attributable, to a large extent, to the work experience-earnings consistency edit. When a person worked 14 weeks or more but reported no earnings, one of his earnings items was changed to a nonresponse and allocated. Similarly when a person reported earnings and no weeks worked, his weeks-worked item was changed to a non-response and allocated.
